

WHY DOCTORS LABORATORY, INC. OFFERS THE THINPREP PAP TEST WITH IMAGER

Doctors Laboratory with our "First in Service, First in Quality, First in Dependability" creed has been a leader in the laboratory industry for over 40 years. We are consistently introducing relevant new technologies and offering it to our physician clients' and their patients' in a timely manner. We were among the first independent laboratories in the Southeast to offer Cytoc's ThinPrep plus Imaging Pap test.

We began using the ThinPrep plus Imager in February 2004 and have witnessed increased detection rates in significant areas.

In reviewing the chart you can appreciate the increased detection of Mild and High Grade Dysplasia over both conventional paps as well as the other liquid based pap technology. In real terms this increased level of detection would equate to a 25% increase in detected LSIL lesions over SP and a 38% increase over convention pap smears. The effect is similar for HSIL with a 24% increase in detected HSIL lesions over SP and a 41% increase over conventional pap smears.

Cytoc ThinPrep Pap with Imager offers increased detection, but also offers:

- A test FDA approved as significantly more effective than the conventional pap.
- FDA approved HPV testing out of the vial.
- FDA approved CT/NG testing out of the vial.
